

Assembly of pigtail components

Overview

This manual provides a comprehensive study of pigtail cable assemblies that includes how they are made, what they do, and why we need them. By explaining what types of connectors are usually used together with these cables, we can understand better why connections need to be. A pigtail wire harness is a type of wiring assembly with a connector on one end, compatible with the target device (such as an ECU in automotive applications), and individual stripped wires on the other. These stripped wires, called pigtails, allow easy integration into existing wiring systems. They contain 5 uninsulated butt splices, 5 pieces of dual wall adhesive-lined heat shrinkable tubing, and the new instruction sheet detailing the approved wire splice procedure as defined by Ford Motor Company. Expanded wire gauge applications for these splices can be found in Technical Service. Short answer: An automotive wiring pigtail is a short section of wire with a pre-attached connector that lets you repair or replace a damaged plug without replacing the entire harness. You only need to plug the connector into your device and link the wires to a secondary component when using it. This pigtail technique is applicable in several home and automotive wiring projects, especially for circuit grounding

wires.
