

# How to adjust the wavelength of a laser diode

## Overview

How can the wavelength of a laser diode be tuned?

Laser diodes are commonly tuned by changing their temperature, for example with a thermoelectric cooler. This modifies the gain spectrum and shifts the output wavelength, typically achieving a tuning range of a few nanometers. This is where laser diode temperature tuning becomes the engineer's most powerful tool turning an out-of-spec component into a precision light source without replacing a single part. Why do Wavelengths Shift in Laser Diodes?

Laser diodes differ fundamentally from gas lasers in how their emission. The first method is to influence the laser gain medium in such a way that the wavelength of maximum gain is changed, and the output wavelength changes accordingly (Figure 1). by altering the angle of incidence on the grating. Optimized diode control will reduce.
