

# How to use Huijue single-mode fiber optic cable

## Overview

Yes, single-mode fiber can transmit and receive data simultaneously. There are two ways to achieve this. We use wavelength division multiplexers (WDM Transceivers) to use this method. Single-mode fiber is being viewed as the backbone of enterprise connections, and it is used to facilitate all 400G solutions and real-time AI solutions/applications, due to its ability to transmit data over long distances with minimal signal loss. Generally, single mode cable has a narrow core diameter of 8 to 10 $\mu$ m (micrometers), which can propagate at the wavelength of 1310nm and 1550nm. Modes of light can only propagate through. But not all fiber cables are created equal: multimode (MM) and single mode (SM) fibers are the two primary types, each engineered for specific use cases, from short-range data center connections to transcontinental telecom backbones. This guide breaks down their technical differences, performance. There are two main types of fiber optic cables: single mode and multimode. Although they can do the same job in some instances, the different construction methods make each of them better suited to certain tasks and budgets.
