

# Performance comparison intelligent optical path switch vs single-mode vs multi-mode

## Overview

Single Mode fibers have a smaller core, allowing light to travel in a single, straight path, ideal for long distances with less signal loss. This single light path is launched by a narrow-linewidth laser source, which travels with minimal modal dispersion, allowing the optical signal to preserve its shape over. The fundamental difference lies in the path light takes through the fiber cable. Distance: SMF (OS2) is built for kilometers (up to 100km+); MMF (OM3/OM4/OM5) is built for meters (up to. In the complex landscape of fiber optic infrastructure, selecting the right cable type—single-mode (OS1/OS2) or multimode (OM1/OM2/OM3/OM4/OM5)—can define a network's speed, reach, and cost-effectiveness. Both have distinct characteristics that impact performance, cost, and application suitability. Choosing the right fiber depends heavily on the physical environment and the required throughput.
