

## Relationship between optical communication and optical modules

### Overview

The optical module serves as a crucial component in optical fiber communication systems, operating at the physical layer, which is the lowest layer in the OSI model. Its primary function is to achieve optoelectronic conversion by converting electrical signals into optical signals and vice versa. Due to limitations in space, it focuses mainly on coherent optical systems which are major. Therefore, NASA is developing optical communications to address limitations of radio frequency (RF) communications, including: bandwidth, spectrum and overall size of frequency packages and power used.
