

Upper and lower limits of light reception by optical modules

Overview

The upper limit of the received optical power is the overload optical power, and the lower limit is the receiving sensitivity. The average transmission optical power refers to the optical power output by the light source at the. The methods for detecting the optical power emitted by the optical module include: reading DDM information by the switch, eye diagram test, spectrometer test, optical power meter or optical power instrument test. An understanding of these concepts is pivotal to establishing an effective and efficient optical network.
