## Overview

Normal WDM (sometimes called BWDM) uses the two normal wavelengths 1310 and 1550 nm on one fiber. Dense WDM (DWDM) uses the C-Band (1530 nm-1565 nm) transmission window but with. In fiber-optic communications, wavelength-division multiplexing (WDM) is a technology which multiplexes a number of optical carrier signals onto a single optical fiber by using different wavelengths (i. This allows multiple channels of data to be transmitted simultaneously. Wavelength multiplexers and demultiplexers are needed in order to be able to use wavelength division multiplexing. They are a cost effective method to expand the capacity of existing fiber optic cables. This guide delves into the principles, types, applications, and future trends of WDM.
