

What is the square millimeter size of the incoming line to the distribution box

Overview

For distribution boxes that handle only lighting circuits or small power loads, if the incoming wire size is less than 10 square millimeters and the number of circuit switches is fewer than 20, the width of the box should be calculated by summing the width of the switches and adding. For distribution boxes that handle only lighting circuits or small power loads, if the incoming wire size is less than 10 square millimeters and the number of circuit switches is fewer than 20, the width of the box should be calculated by summing the width of the switches and adding. The maximum length of absorption lines used in conjunction with the gravity distribution shall be 60 feet. (i) For accessibility, it is necessary that the distribution box be located and have a removable cover not more than 12 inches below grade. Lug pad dimensions are included for main incoming line compartments. Front-access switchboards align at the rear.
